

Patient Case Framework Instructions

- Use this Patient Case Framework to build out your concept map. For each concept map you create, use the eight guiding questions below. Refer to the Glossary for help.
- 1 Add your patient case one-liner to the Patient Case box. What are the key elements of the case (history, exam, lab, imaging findings)? Connect them to your Patient Case one-liner using the 'Normal' and 'Abnormal' sticky notes. Which findings are most important for understanding what's going on and why?
 - 2 What are the important basic science concepts from this week's learning objectives (SLOs)? Add them using the 'Basic Science' and 'Pathophysiology' sticky notes. Be specific.
 - 3 How do you explain the connections between the basic science concepts/SLOs and the patient's findings? Use lines with arrows to visually show these connections. To make a link, drag from one shape's connector to another. To label the link, double click and briefly describe the mechanism or causal relationship.
 - 4 Apply your clinical reasoning skills: What are the critical differential diagnoses to be considered for this patient and why? What is the working (most likely) diagnosis and associated illness script? What is your plan for management and why? What are the prognostic considerations? Add stickies and links to explain your thought process in answering these questions.
 - 5 What concepts from Health Systems Science (HSS) influence this case, and how? Add stickies and links to explain these concepts and their connections.
 - 6 What Determinants of Health (DoH) influence this case, and how do they help you shape the patient's condition or access to care? How do they help you understand and interact with the patient? Add DoH icons, links, and a grey sticky note to illustrate and explain these influences.
 - 7 How can you connect the material on your concept map to prior coursework? Create stickies to explain.
 - 8 What are your gaps in understanding this week to bring up in your group discussion? Add your questions to the yellow Gaps in Understanding section.

Glossary

Click the notebook icons in the toolbox for more info

Patient Case One-Liner: A quick snapshot of your patient (i.e., age, sex, key concern).

Key Case Finding: An essential piece of information from the patient's history, physical exam, or test results. It should clearly connect to the following: basic science and pathophysiological mechanisms and help drive the clinical reasoning process.

Basic Science: Foundational knowledge such as anatomy, histology, genetics, biochemistry, cell biology, histopathology, pharmacology, and physiology, including relevant structures (cells, molecules, tissues, organs, and systems). Maps should link these concepts explicitly to the disease process and clinical findings.

Pathophysiology: The underlying mechanisms by which a disease develops, progresses, and causes signs and symptoms. Students should trace the pathway from molecular/cellular disruptions to (→) organ/system manifestations/presentation.

Clinical Sciences & Diagnostic Reasoning: Synthesize findings into a cohesive clinical picture that includes:

- a prioritized differential diagnosis: with justification based on findings and underlying mechanisms
- an illness script for the working diagnosis: the typical presentation of a disease, including risk factors, key findings and pathophysiological reasoning. Include justifications.
- a management plan with rationale: Show how proposed interventions target the pathophysiology and address patient-specific concerns and influence prognosis.

Health Systems Science: 6 concepts that impact the patient's presentation and management: Population and public health, Ethics & leadership, Epidemiology and biostatistics, Healthcare financing, Patient safety & quality, Data and analytics.

Determinants of Health (DoH): Factors that influence a patient's health status and outcomes. The 5 DoH are Biologic-Genetic, Behavioral, Environmental, Healthcare, and Social (i.e., housing, education, income, support). Incorporate how these impact the patient's disease presentation, progression or response to care.

Gaps in Understanding: What is unclear about the basic science, case, underlying mechanisms or diagnosis? Add questions to the yellow Gaps in Understanding section. Be honest; this is how you'll grow. What still needs explanation?

Expand this frame as your map gets larger. (Delete this note as needed)
